Looks like the “winpercent” variable or column is masured on a different scale than everything else. I will need to scale my data before doing any analysis like PCA etc.

- **Q6**. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset?

  The winpercent is in 0-100 range, representing a percentage, whereas other columns from the dataset have a range of 0-1.

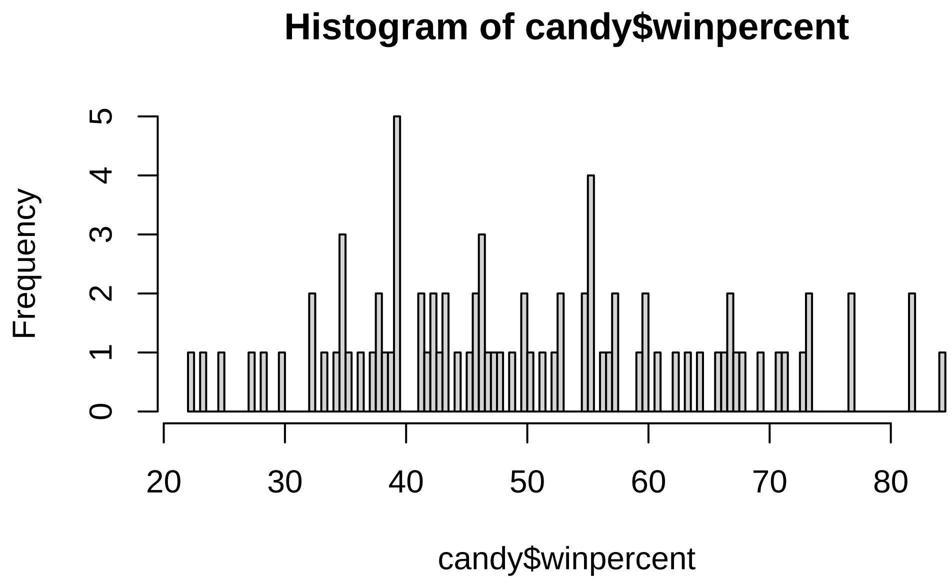
- **Q7**. What do you think a zero and one represent for the `candy$chocolate` column?

  The 0 means this candy is not chocolate, and 1 means this candy is/contains chocolate

- **Q8**. Plot a histogram of `winpercent` values

  We can do this in few ways. e.g. the "base" R 'hist()' function or with 'ggplot'.

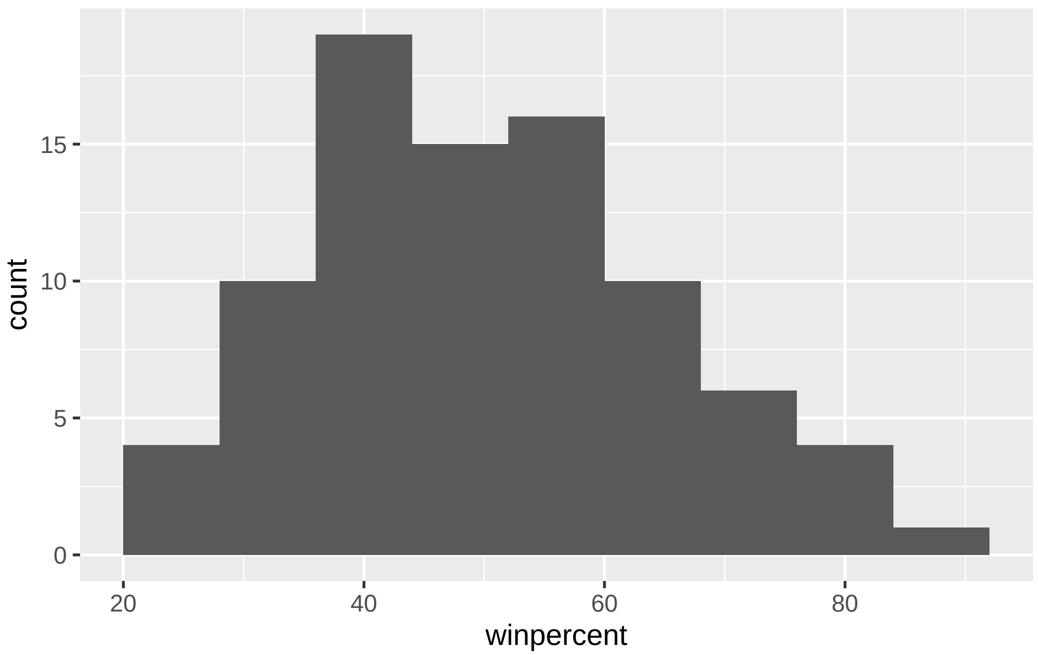
```r
hist(candy$winpercent, breaks = 100)
```



```r
library(ggplot2)
```

```
Warning: package 'ggplot2' was built under R version 4.3.3
```

```r
ggplot(candy)+
  aes(winpercent)+
  geom_histogram(binwidth =8)
```



- **Q9**. Is the distribution of `winpercent` values symmetrical?

  No

- **Q10**. Is the center of the distribution above or below 50%?

```
summary(candy$winpercent)
```

```
   Min. 1st Qu.  Median    Mean 3rd Qu.    Max. 
  22.45   39.14   47.83   50.32   59.86   84.18 
```

- **Q11**. On average is chocolate candy higher or lower ranked than fruit candy?

```

    Welch Two Sample t-test

data:  choc.candy$winpercent and fruit.candy$winpercent
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0

Yes. The p-value is small, indicating that we can reject the null hypothesis and state there is significant differences between the mean between winpercent of fruity candy and chocolate candy.

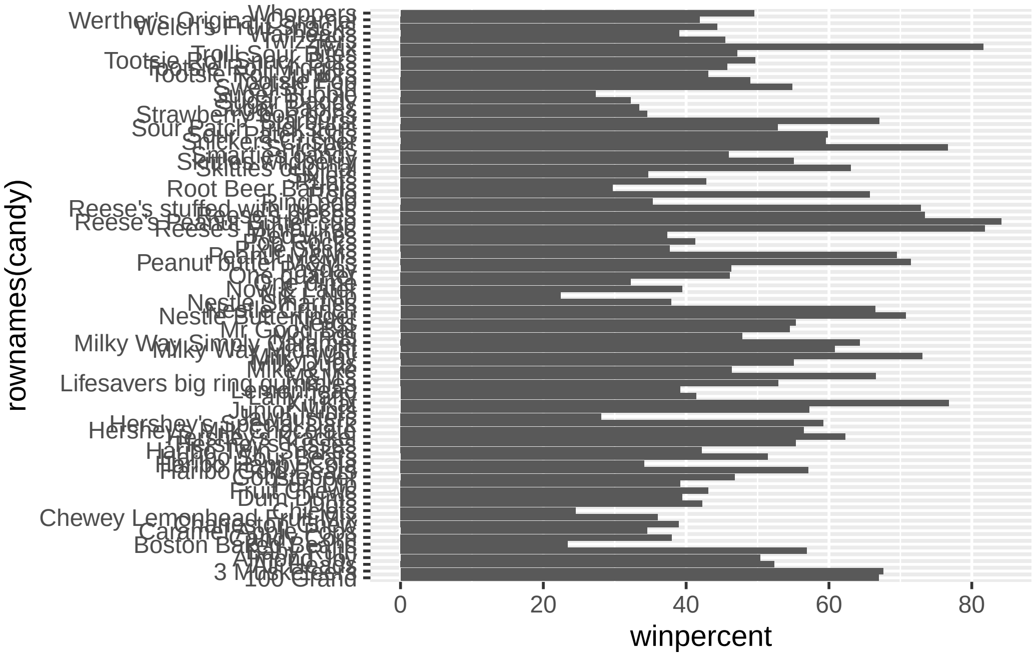
- **Q15**. Make a first barplot of candy ranking based on `winpercent` values.

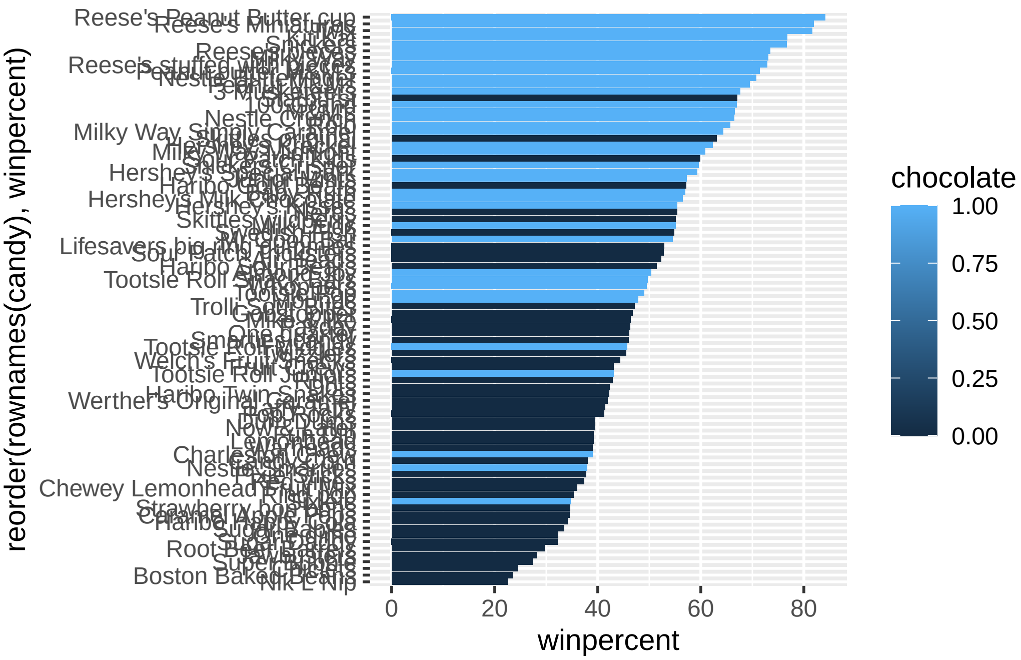
  lets do a barplot

```
ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```



- **Q16**. This is quite ugly, use the `reorder()` function to get the bars sorted by `winpercent`?

```
ggplot(candy)+
  aes(x=winpercent,
      y= reorder(rownames(candy),winpercent),
      fill=chocolate)+
  geom_col()
```



I want a more custom color scheme where I can see both chocolate and bar and fruity etc. all from the one plot. To do this, we can roll our own color vector…

```
mycol<- rep("black",nrow(candy))
mycol[as.logical(candy$chocolate)] <- "chocolate"
mycol[as.logical(candy$bar)] <- "red"
mycol[as.logical(candy$fruity)] <- "pink"
mycol[row.names(candy)=="Skittles original"] <- "blue"
```

```
ggplot(candy)+
  aes(x=winpercent,
      y= reorder(rownames(candy),winpercent),
